

Sodium Dichloroacetate

a non toxic substance for cancer: brain, breast, lung, and Non Hodgkin Lymphoma

pureDCA.com

Dear Colleagues. For over a year I have been trying to find out about the sodium dichloroacetate after hearing about it in the paper. since I am a former FDA official and physician/scientist, I was cautious and skeptical, so I did not suggest this for patients to take. However a patient of mine in california whom I was consulting had already had hundreds of thousands of dollars spent on his Non Hodgkins lymphoma treatment and after a while all the tumors came back so he could not even get on a t-shirt they were so large. He found this compound, a by product of chlorinating water, and took it at his own risk since there wasn't that much data for safety and efficacy. In 7 weeks the tumors were all gone. Now he is slowly tapering off form this to see what happens. I am quite surprised and saw his CT's recently. We shall publish this as a case study since he wasn't on anything else. My colleagues in Canada, tell me that it does not work on pancreas well, nor sarcoma, but appreas to be very beneficial in many other types of cancers. colon, Breast, liver, lung. Might be dangerous for brain, but so far the information is very interesting and I just wanted to share this with you. We shall observe his condition and keep you all posted if you are interested. I warned him that this is not a "cure" not a "treatment", it appears to help the body rid the cancers through it's own immune system, or perhaps by reestablishing the aerobic metabolism in the cancers mitochondria. It is said it works on the mitochondria in the cancer cells. I shall be researching more on this topic. Please red the patients personal account on this below.

My best regards,

Dana
